Abstract

Reversing the flow of time between Casimir plates raises the question of whether or not a recently deceased, intact organism could be brought back to life. The odds are not good.

Discussion

According to special relativity, a “stationary” observer would determine the energy content of a mass moving with constant relative velocity to be

$$E = mc^2 = \left(\frac{m_o}{\sqrt{1 - \frac{v^2}{c^2}}} \right) c^2 . \quad (1)$$

That same observer would also find

$$\Delta t = \Delta t_o \sqrt{1 - \frac{v^2}{c^2}} , \quad (2)$$

where Δt represents the number of seconds that goes by on the moving mass, and Δt_o is the number of seconds that goes by in the stationary frame.

Multiplying equation (2) by equation (1) results in

$$E\Delta t = (m_o c^2) \Delta t_o = E_o \Delta t_o . \quad (3)$$

Evidently the energy time-flow product is invariant under special relativity such that

$$E_1 \Delta t_1 = E_2 \Delta t_2 \quad (4)$$

from frame to frame.

Equation (4) also applies to a photon leaving a Schwarzschild metric, and two possibilities come to mind. Either equation (4) is universally applicable (i.e.- beyond the confines of special relativity), or there must be two different kinds of energy; the kind that is accompanied by time dilation, and the kind that is not accompanied by time dilation.

If equation (4) does apply everywhere, and if the energy density between Casimir plates is truly negative, then it may be possible to reverse the flow of time between Casimir plates in accordance with¹

$$E_1 \Delta t_1 = (-E_2) (-\Delta t_2) . \quad (5)$$

That possibility brings to mind an interesting question. Suppose some tiny biological organism - small enough to fit between the two plates - was allowed to expire from “old age”. Could that organism then be brought back to life by immediately placing it in the region of negative time flow between the plates ?.

Several considerations argue against this happening. For one thing, the energy density of the dead organism would still be positive, even though the organism was immersed in a region of negative energy density. So time might still flow forwards inside the organism. On the other hand, the time direction probably cannot contain jump discontinuities. There would have to be some sort of smooth transition at the surface of the organism between the region of forward time flow inside the organism, and the region of backward time flow outside the organism. So the overall effect is not clear. Further, even if time did flow backwards throughout the entire organism, there is no guarantee that an “instant replay” effect would occur. The components of the dead organism might just get younger without “rewinding the tape” and rekindling the spark of life.
